The present sequence is a partial coding sequence for human endostatin. A claimed method for the treatment of ocular endostatin. A claimed method for the treatment of ocular encovacularisation, especially choroidal neovascularisation, involves increasing the level of endostatin in ocular tissue, especially where the endostatin is encoded by the present sequence, or is its fragment, derivative or variant. The increase is effected by administering a retrovirus or lentivirus vector, adeno-associated virus, a retrovirus or lentivirus vector, comprising an endostatin-encoding nucleic acid. Cells secreting endostatin may be encapsulated and implanted within an individual. The method is used when ocular neovascularisation is caused by istoplasmosis, pathological myopia, angioid streaks, anterior ischaemic optic neuropathy, bacterial endocarditis, Best's disease, birdshot retinochoroidopathy, choroidal osteomas, choroidal cupture, choroidal nonperfusion, choroidal osteomas, choroidal cupture, choroidelenaemia, chronic retinal detachment, coloboma of the retina, brusen, endoseous Candida endophthalmitis, extrapapillary hamartoma of the retinal pigmented epithelium, extrapapillary hamartoma of the retinal pigmented epithelium,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating or preventing choroidal neovascularization comprises increasing the amount of endostatin in ocular tissues of afflicted individuals to a choroidal neovascularization inhibiting level -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                fundus flavimaculatus, idiopathic, macular hole, malignant melanoma, membranproliferative glomerulonephritis (type II), metallic intraocular foreign body, morning glory disc syndrome, mutiple evanescent white-odc syndrome, neovascularisation of ora serrata, operating microscope burn, optic nerve head pits, photocoagulation, punctate inner choroidopathy, rubella,

121 gescrescesceacerrecececerrecrerecresecereceseseserateraceae 180
may exhibit useful properties such as having similar or greater biological activity when compared to a single factor or by having improved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells (characteristic of lung, breast, ovarian, prostate, pancreatic, gastric, colon, renal, bladder cancers; melanoma, hepatoma, sarcoma and lymphoma) in a patient and for inhibiting tumor growth. The present sequence is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GlyLeuAlaGlyThrPheArgAlaPheLeuSerSerArgLeuGlnAspLeuTyrSerIle

The present sequence encodes human endostatin. The protein is expressed in Streptomyces. Leader sequences of Streptomyces sp. strain C5 anp and S. venezuelae alpha-amylase proteins are linked to the S. venezuelae alpha-amylase proteins are linked to the N-terminal of endostatin. This ensures that endostatin protein is produced as a secreted, soluble protein which needs no refolding, is stable in the fermentation broth and is produced in large quantities. The method is used for preparing soluble recombinant human, murine or primate endostatin, which is useful in the treatment of cancer. Inhibition of tumour growth, inhibition of angiogeneiss, isolation of receptors for endostatin and for identification of anti-angiogenic compounds in assays. The endostatin protein is produced as a secreted, soluble protein which needs no refolding, is stable in the fermentation broth and is produced in large quantities. Streptomycetes are amenable for cultivation in large fermentations allowing for large quantities of soluble endostatin to be produced.

PREENT NO. 6201104
GENERAL INFORMATION:
APPLICANT: MacDonald, Nicholas
APPLICANT: Sim, Kim Lee
TITLE OF INVENTION: Anglogenesis-Inhibiting Protein Binding Peptides and
TITLE OF INVENTION: Proteins and Methods of Use
TITLE OF INVENTION: Proteins and Methods of Use
TITLE REFERENCE: 05513-0370
CURRENT APPLICATION NUMBER: US/09/206,059
CURRENT PILING DATE: 1998-12-04
NUMBER OF SEQ ID NOS: 80
SOFTWARE: PALENTIN Ver. 2.0
SEQ ID NO 30

GENERAL INFORMATION:

APPLICANT: Mixson, James A

TITLE OF INVENTION: CARRIER: DNA COMPLEXES CONTAINING DNA

TITLE OF INVENTION: ENCODING ANTI-ANGIGGENIC PEPTIDES AND THEIR USE IN GENE

TITLE OF INVENTION: THERAPY

NUMBER OF SEQUENCES: 43

CORRESPONDENCE ADDRESS:

ADDRESSEE: Connolly, Bove, Lodge, & Hutz

STREET: 1220 Market Street, P.O. Box 2207
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        140 GGCACCTTCCGGGCTTTCCTGTCCTCTAGGCTGCAGGATCTCTATAGCATCGTGCGCCGT 199

Sequence 12, Application US/09561499

Sequence 12, Application US/09561499

GENERAL INFORMATION:
APPLICANT: Philip E. Thorpe

APPLICANT: Rolf A. Breaken

TITLE OF INVENTION: ANTHEODY METHODS FOR SELECTIVELY INHIBITING VEGF

FILE REFERENCE: 4001.002582

CURRENT PAPLICANTION NUMBER: US/09/561,499

CURRENT PAPLICATION NUMBER: 60/131,432

PRIOR APPLICATION NUMBER: 60/131,432

PRIOR FILING DATE: 1999-04-28

NUMBER OF SEQ ID NOS: 44

SOFFWARE: Patentin Ver: 2.0

SEQ ID NO 12

LENGTH: 573

TYPE: DNA

CORGANISM: Artificial Sequence

/clone_lib="CSEQRBNI"
/note="Organ: ovary; Vector: pBluescript II KS(+); Site_1:
ECORI; Site_2: Not1; This normalized library was
constructed from 1 million independent clones. cDNA
synthesis was initiated using an oligo(dT) primer, using
methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to NotI adapters; digested with ECORI
, size-selected, and cloned into the NotI and ECORI
compatible sites of a custom modified MCS of the
pools of total RNA isolated from each tissue (embryonic muscle 33.3%; juvenile muscle 33.3%; and epiphyseal growth plate 33.3% of the final RNA pool). Single pass sequencing from 5'-end"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gallus gallus

               rounds using conditions adapted from Soares et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6 (1996): 791, except that a significantly longer reannealing hybridization was used."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note=_Organ: brain; Vector: pBluescript II KS(+); Site_I: BcoRI; Site_2: Not1; This normalized library was constructed from 1 million independent clones. cDNA synthesis was initiated using an oligo(dT) primer, using methylated C in the first strand synthesis reaction. Following this first strand reaction, double-stranded cDNA was baunted, ligated to NotI adapters, digested with EcoRI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Archosauria; Aves; Neognathae; Galliformes; Phasianidae; Phasianinae; Gallus.

```
, size-selected, and cloned into the NotI and ECORI compatible sites of a custom modified MCS of the pBluescript (KS+) vector. The library was normalized in 2 rounds using conditions adapted from Soares et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6 (1996): 791, except that a significantly longer reannealing hybridization was used."

/noce="Organ: kidney + adrenal; Vector: pBluescript II
KS(+); Site_l: EcoRI; Site_2: Not1; This normalized
library was Constructed from 1 million independent clones.
cDNA synthesis was initiated using an oligo(dT) primer,
using methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to NoI adapters, digested with EcoRI
compabible sites of a custom modified MCS of the
pBluescript (KS4) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6

//clone lib="Vector: pBluescript II KS(+); Site_1: ECCRI;
Site_2: Nort; This normalized library was—constructed from site_2: nort; primer clones. CDNA synthesis was initiated using an oligo(dT) primer, using methylated C in the first strand synthesis reaction. Following this first strand reaction, double-stranded cDNA was blunted, ligated to NotI adapters, digested with EccRI, size-selected, and cloned into the NotI and ECCRI compatible sites of a custom modified MCS of the pBluescript (KS+) vector. The library was normalized in 2 rounds using conditions
